What types of synthetic content are there?

AI-generated texts

Language models can generate various types of text. The more content the AI generates on its own, the more clearly it is synthetic content.

AI-generated and manipulated images

Image generators can create new images or modify existing ones. If people, objects, backgrounds, or scenes are substantially generated or replaced, the result is considered synthetic content.

Synthetic Voices and Audio

AI can generate, replicate, or modify voices. Its applications range from digital voiceovers and translations to voice cloning.

AI Videos and Deepfakes

Generative systems can generate individual sequences or entire videos. Deepfakes are particularly relevant in this context, as they depict real people in fictional situations in a deceptively realistic manner.

Multimodal Content

Multimodal systems combine multiple media formats (text, images, audio, video) within a single production process.
